Household debt and the OECD's surveillance of member states

Workshop on household debt – a challenge for the future?
Copenhagen – 24 September 2014

Christophe ANDRÉ
OECD Economics Department
Outline of the presentation

Household debt and assets across OECD countries
- Household debt and asset aggregates
- Distribution of debt across household categories

Drivers of household debt
- Housing prices and household debt
- Low interest rates and financial innovation

Implications for financial stability
- Credit risk
- Funding risk

Macroeconomic implications
- Household debt and risk of recession
- Depth and length of “high-debt” recessions

OECD Surveillance
Conclusions
Household debt and assets across OECD countries
Household debt
As a percentage of net disposable income

Source: OECD National Accounts Statistics.
Household assets and liabilities in G7 countries, 2001-2012

As a percentage of net disposable income

Source: OECD National Accounts Statistics.
Household assets and liabilities in Denmark

As a percentage of net disposable income

Source: OECD National Accounts Statistics.
Household assets and liabilities in Sweden

As a percentage of net disposable income

Source: OECD National Accounts Statistics.
Household assets and liabilities in Norway

As a percentage of net disposable income

Source: OECD National Accounts Statistics.
Household assets and liabilities in the Netherlands

As a percentage of net disposable income

Mortgage market innovations have flourished during the boom

- Extension of loan terms
- Increased share of adjustable-rate mortgages
- Higher loan-to-value ratios
- Deferred amortisation loans (interest-only, flexible repayments…)
- Housing equity withdrawal (cash out refinancing, home equity loans)
- Subprime loans (and more generally weaker lending standards)
- Securitisation
Interest-only loans and repayment strategies

Note: The cycle is the classical business cycle. The size is the cumulative percentage change in the level and the length is the number of quarters of the contraction or expansion phases.
High (low) debt = 50% of business cycles with highest (lowest) de-trended debt-to-GDP ratios.
OECD Surveillance
Monitoring of debt and housing statistics

Debt and asset statistics
- OECD Economic Outlook: Annex Table 58 (G7 countries)
- Increasing number of countries covered in National Accounts
- Lack of micro-data

Housing prices, price-to-income and price-to-rent ratios
- OECD Economic Outlook: Annex Table 59-60
- Series available for most countries
- Still huge gaps, in particular in terms of comparability; levels rarely available
- Price-to-income and price-to-rent ratios: useful indicators, but need to be interpreted with caution

Other housing statistics
- Residential investment, construction output, building permits…
Prices are falling relative to income in some countries

Price-to-income ratios, long-term average = 100

Source: OECD calculations.
Price-to-income ratios remain high in some countries

Price-to-income ratios, long-term average = 100

Source: OECD and national sources.
How to avoid credit bubbles and excessive debt?

Sutherland et al. (2012) [*OECD Economics Department Working Paper No. 1003*]

- First line of defence: micro-prudential regulation
- Second line of defence: macro-prudential policy
- Third line of defence: monetary policy

The propagation of financial shocks depends on housing market features

- Supply responsiveness
- Taxation
- Balance of tenures...
First line of defence: micro-prudential

Return to the “basics”

- Sound underwriting: ability to repay and documentation (income, assets…)
- Appropriate incentives and transparency
- High loan-to-value ratio loans: more capital or mortgage insurance
- Non-amortising loans should be granted with great caution
- Adequate capital buffers for lenders and insurers

Areas requiring close monitoring

- Loans to developers and construction companies
- Loans for commercial property
- Lenders’ funding model: maturity (and currency) mismatch
Second line of defence: macro-prudential

**Instruments**
- Caps on loan-to-value ratios, loan-to-income or debt-to-income ratios
- Risk weights on residential mortgages
- Countercyclical buffers
- Dynamic provisioning
- Liquidity requirements
- Measures targeted at foreign-currency lending
- …

**Implementation issues**
- Trigger
- Responsibility
- Risk of circumvention
Third line of defence: monetary policy

Identification of a bubble
- About 60% of large real housing price upswings (25% increase over 5 years) end in a bust (Girouard et al. (2006), OECD Economics Department Working Paper No. 475)
- Relevant indicators: credit growth, liquidity, property prices… (e.g. BIS, ECB)
- Other information (e.g. underwriting practices, funding structures…)

Effectiveness of interest rate hikes
- Large hikes may be needed, with a big impact on output and inflation
- Ex: Riksbank MPR Feb. 2014: unexpected lowering of the repo rate by one percentage point during a quarter -> Peak impact: household debt ratio ≈ +1.5%; Real GDP ≈ +0.5%

Rationale for action
- Cost of “high debt” crises
- Systemic risk
- Failure of other instruments
A very steep yield curve may encourage excessive maturity transformation

Source: OECD Economic Outlook database.
A more holistic approach to housing is needed

Demand side:
- Tax systems often encourage home-ownership. Mortgage interest deductibility can be costly and tends to be regressive. If supply is rigid, capitalisation of tax advantage in housing prices

Supply side:
- Zoning and planning regulations are often excessively tight
- Infrastructure investment is sometimes insufficient
- Supply of new affordable/social housing is often low (partly because of costs and potential side-effects – segregation, weakening work incentives and mobility)
- Private rental market regulations (rent control, balance of protection of tenant and landlord rights) are hampering the development of the rental market in some countries
Surveillance in OECD Economic Surveys

**Macroeconomic section (Assessment and recommendations)**
- Analysis of risks related to household debt, housing market indicators

**Special chapters on housing in recent Surveys**
- Canada, Chile, France, Israel, Norway, the Netherlands, New Zealand, Sweden, United Kingdom
- Forthcoming: Belgium, South Africa and Switzerland
- Other: Background paper on housing in Finland; Focus on the social implications of household debt in Korea

**Typical areas for recommendations**
- Financial stability
- Taxation
- Planning and zoning
- Competition in construction
- Support for the most vulnerable
Household debt may entail risks for households, the financial system and the wider economy. Hence, it needs to be watched closely.

However a high level of debt is not a sufficient indicator of risk.

Micro-data on debt and assets need to become more widely available.

Micro-prudential: monitor the quality of underwriting

The funding of mortgages: beware of excessive maturity (and currency) mismatch

Macro-prudential: key to dealing with the credit/housing cycle, but work-in-progress

Monetary policy: last line of defence

A more holistic approach to housing markets is needed
Thank you!
